

Instructions

Loading

1. Select G8F in the scene.
2. Load Auto-Load script.

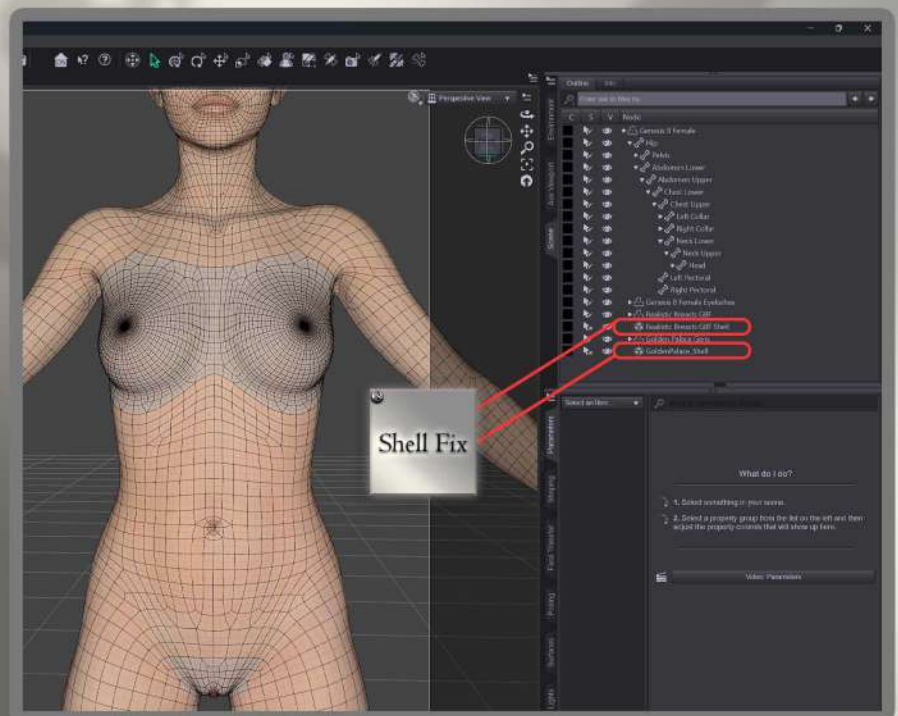

Note: If you are using Daz studio 2025+ Alpha, load Auto-Load for Daz 2025+

Manual Loading

1. Select G8F in the scene.
2. Load Graft
3. Load Shell
4. Load Material Copy script.

Shell Fix

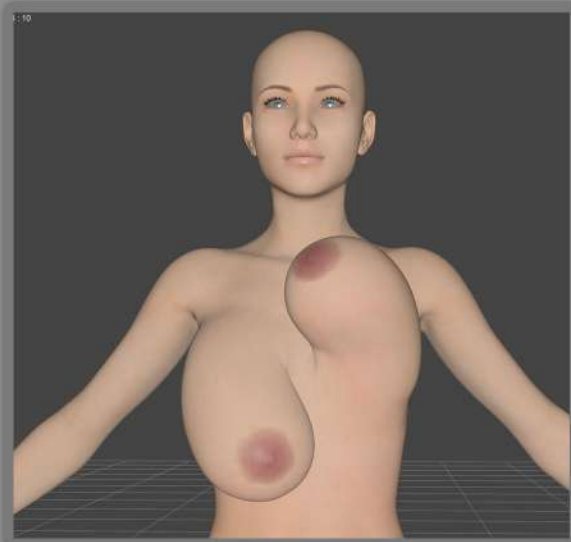

Select all shells in the scene and apply the Shell Fix to each one individually.

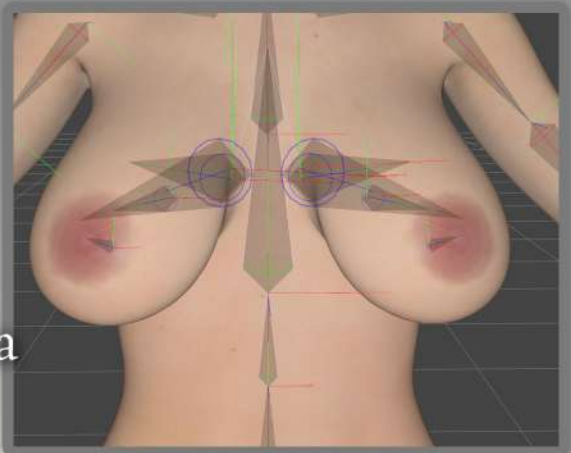

Posing

Each breast includes four fully poseable bones—Pectoral 2, Breast, Areola, and Nipple—on both the left and right sides. All bones support rotation, translation, and scaling, with intentionally loose limits so you can achieve more extreme and expressive poses.

For strong breast bending, use a combination of the Left/Right Pectoral 2 and Left/Right Breast bones to push the breasts upward, downward, or sideways. The Areola bone allows you to fine-tune the direction and orientation of both the areola and the nipple for precise shaping. All bones are selectable in the scene.

Shaping presets

All shaping presets—including breast shapes, areola and nipple shapes, and custom shapes—load directly onto Genesis 8 Female. Their sliders can be found under Actor / Chest / RH-Realistic Breasts G8F-Shapes if you want to adjust them manually. Each shape category includes its own Zero Shape preset for quick resetting.

The Nipples Scale and Nipples Tall sliders are designed for manual adjustment and also have their own shaping presets. These controls are located under Actor / Chest / RH-Realistic Breasts G8F-Shapes / Nipples.

Materials

Materials load onto the Realistic Breasts G8F Shell. The product includes three sets of eight materials, allowing you to match a wide range of skin tones. Each material set also includes additional adjustment presets—such as opacity control and glossiness shape presets—so you can fine-tune subtle differences and achieve the exact look you want.
